

PATENT  
Attorney Docket No. 450128-04021.1

IN THE CLAIMS

Claims 1-32 are presented below, with claims 18-32 pending. As shown below, please cancel claims 1-11 and add new claims 18-32.

1 - 17. (Canceled)

18. (New) A case of a folder type for accommodating a recording medium, comprising:

a first member being a cover of said case, and  
a second member being another cover of said case;  
wherein in a surface of said first member to be the inner side of the case, a first accommodating region for accommodating said recording medium, which has a frame portion defining a substantially circular periphery, and a second accommodating region for accommodating a recording device, which has one or more protruding portions defining a substantially polygonal periphery, are disposed so as not to substantially overlap to each other.

19. (New) A case of a folder type according to claim 18, wherein

in a surface of the second member to be the inner side of the case, a manual holding portion for holding a manual is provided.

20. (New) A case of a folder type according to claim 18, wherein

the surface of the first member to be the inner side of the case has a substantially rectangular shape, and

PATENT  
Attorney Docket No. 450128-04021.1

the first accommodating region and the second accommodating region are disposed side by side in the longitudinal direction of the surface of the first member to be the inner side of the case.

21. (New) A case of a folder type according to claim 20, wherein

the first accommodating region and the second accommodating region are disposed such that central lines thereof in the longitudinal direction of the surface of the first member to be the inner side of the case agree to each other.

22. (New) A case of a folder type accommodating a disc-type recording medium, comprising:

a first member being a cover of said case, and

a second member being another cover of said case

wherein in a surface of said first member to be the inner side of the case, a first accommodating region accommodating said disc-type recording medium, which has a frame portion defining a substantially circular periphery, and a second accommodating region for accommodating a recording device, which has one or more protruding portions defining a substantially polygonal periphery, are disposed so as not to substantially overlap to each other.

23. (New) A case of a folder type accommodating a disc-type recording medium according to claim 22, wherein

in the frame portion of the first accommodating region, a stepped portion is provided so that the recording area of the disc-type recording medium does not come into contact with the surface of the first member to be the inner side of the case.

PATENT  
Attorney Docket No. 450128-04021.1

24. (New) A case of a folder type accommodating a disc-type recording medium according to claim 22, wherein

in a surface of the second member to be the inner side of the case, a manual holding portion for holding a manual is provided.

25. (New) A case of a folder type accommodating a disc-type recording medium according to claim 22, wherein

the surface of the first member to be the inner side of the case has a substantially rectangular shape, and

the first accommodating region and the second accommodating region are disposed side by side in the longitudinal direction of the surface of the first member to be the inner side of the case.

26. (New) A case of a folder type accommodating a disc-type recording medium according to claim 25, wherein

the first accommodating region and the second accommodating region are disposed such that central lines thereof in the longitudinal direction of the surface of the first member to be the inner side of the case agree to each other.

27. (New) A case of a folder type accommodating a disc-type recording medium and a card-type recording device, comprising:

a first member being a cover of said case, and

PATENT  
Attorney Docket No. 450128-04021.1

a second member being another cover of said case;  
wherein in a surface of said first member to be the inner side of the case, a first  
accommodating region accommodating said disc-type recording medium, which has a frame  
portion defining a substantially circular periphery, and a second accommodating region  
accommodating said card-type recording device, which has one or more protruding portions  
defining a substantially polygonal periphery, are disposed so as not to substantially overlap to  
each other.

28. (New) A case of a folder type accommodating a disc-type recording medium and a card-type  
recording device according to claim 27, wherein

the card-type recording device has a concave-convex portion in its side surface, and  
the protruding portions which the second accommodating region has, are disposed so as  
to avoid the concave-convex portion of the accommodated card-type recording device.

29. (New) A case of a folder type accommodating a disc-type recording medium and a card-type  
recording device according to claim 27, wherein

in the frame portion of the first accommodating region, a stepped portion is provided  
so that the recording area of the disc-type recording medium does not come into contact with the  
surface of the first member to be the inner side of the case.

30. (New) A case of a folder type accommodating a disc-type recording medium and a card-type  
recording device according to claim 27, wherein

PATENT  
Attorney Docket No. 450128-04021.1

in a surface of the second member to be the inner side of the case, a manual holding portion for holding a manual is provided.

31. (New) A case of a folder type accommodating a disc-type recording medium and a card-type recording device according to claim 27, wherein

the surface of the first member to be the inner side of the case has a substantially rectangular shape, and

the first accommodating region and the second accommodating region are disposed side by side in the longitudinal direction of the surface of the first member to be the inner side of the case.

32. (New) A case of a folder type accommodating a disc-type recording medium and a card-type recording device according to claim 27, wherein

the first accommodating region and the second accommodating region are disposed such that central lines thereof in the longitudinal direction of the surface of the first member to be the inner side of the case agree to each other.
